Module Code & Module Title

CS4001NI Programming

Assessment Weightage & Type 30%

Individual Coursework

Year and Semester

2021-22 Spring - 2

Student Name: Anju Kumari Yadav

Group: C15

London Met ID: 22015649

College ID: NP01CP4S220194

Assignment Due Date: 2022 5th August

Assignment Submission Date: 2022 5th August

I confirm that I understand my coursework needs to be submitted online via Google Classroom under the relevant module page before the deadline in order for my assignment to be accepted and marked. I am fully aware that late submissions will be treated as non-submission and a mark of zero will be awarded.

1. Introduction

1.1 About Coursework

The project I created for the first assignment of the coursework will now have a TransportGUI class. I must create a graphical user interface (GUI) for a system that maintains information about the vehicle and its details in an ArrayList for the second coursework. The primary method will be contained in the class, which will also be tested via the command line. Additionally, I will be required to produce a report on your program. There are 4 classes total in this project. auto, autorickshaw, electric scooter, and transport GUI. In this instance, the vehicle is shown as the parent class, while the others are subclasses. Subclasses include the autorickshaw and electric scooter. Additionally, the vehicle class inherits both of the subclasses.

In that project, I add a new class called TransportGUI. I Uploaded my TransportGUI.java file along with the Vehicle.java, AutoRickshaw.java, and ElectricScooter.java files from the first section of the coursework submitted.

The components of my GUI are the same, but I am free to use a different layout if I think it will enhance its appearance, usability, etc. An array list (not an array) of the type Vehicle class should be kept in the TransportGUI class to hold the ElectricScooter and AutoRick Shaw.

1.2 Tools Used

a. BlueJ

BlueJ is a development environment that helps us to create and develop Java apps quickly and easily. This tool has a user-friendly interface that allows newbies to get started without feeling overwhelmed. BlueJ was created primarily for educational purposes. Many universities have BlueJ-based courses are now available. This application is Windows compatible. Mac OS X, Linux, and several other operating systems are all available. BlueJ exemplified a few features that are not available in other IDEs.

b. MS-Word

Microsoft Word is a commercial, non-free word processor created by Microsoft. It was first launched in 1983 for Xerox systems under the name Multi-Tool Word. Later versions were built for a variety of platforms, including IBM PCs running DOS (1983), Apple Macintosh (1984), AT&T Unix PC (1985), Atari ST (1986), and Microsoft Windows (1987). (1989). It is part of the Microsoft Office system, but it is also available as a standalone application and as part of the Microsoft Works Suite. Microsoft Word 2010 for Windows and 2011 for Mac are the most recent versions. Microsoft Word is a processor that can create simple and complex writings. The application can be downloaded to your hard drive or used online. You may share and collaborate on your files with others in real time with the online version. The application supports Windows, macOS, cell phones, and tablets.

c. Draw. IO

Draw.io is a free online diagramming tool that lets you create charts and diagrams. You can either create a custom layout with the application or use the automated layout option. They have many shapes and hundreds of them. visual elements that can be used to create diagrams and charts. The drag-and-drop feature makes constructing a professional-looking diagram or chart a breeze. A piece of cake We can create flowcharts, UML diagrams, and entityrelationship diagrams for you. Mock-ups, schematics, network diagrams, and more the draw.io application saves data. Google Drive, OneDrive, and other options are available through the program. Others include Dropbox, GitHub, and GitLab.

2.6 Combined Class Diagram of all class including GUI class

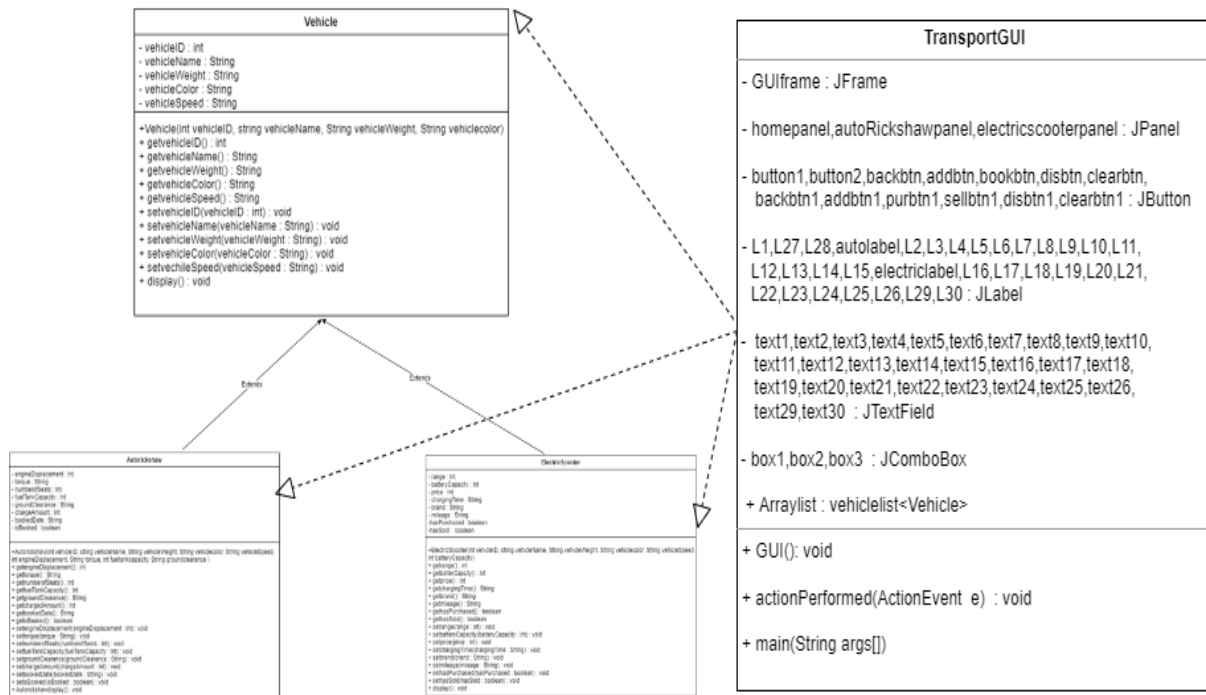

Figure 6: Combined Class Diagram of all class including GUI class

3 Pseudocode

3.1 Pseudocode of Transport GUI

START

CREATE a class TransportGUI which implements ActionListener interface

DO

DECLARE and **INITIALIZE** an ArrayList vehiclelist type of vehicle class

DECLARE an instance variable JFrame as GUIframe

DECLARE an instance variable JLabel as homepanel, autorickshawpanel, electric scooterpanel

DECLARE an instance variable JButton as button1, button2, backbtn, addbtn, bookbtn, disbtn, clearbtn, backbtn1, addbtn1, purbtn1, sellbtn1, disbtn1, clearbtn1

DECLARE an instance variable JLabel as L1, autolabel, L2, L3, L4, L5, L6, L7, L8, L9, L10, L11, L12, L13, L14, L15, electriclabel, L16, L17, L18, L19, L20, L21, L22, L23, L24, L25, L26, L27, L28, L29, L30

DECLARE an instance variable JTextField as text1, text2, text3, text4, text5, text6, text7, text8, text9, text10, text11, text12, text13, text14, text15, text16, text17, text18, text19, text20, text21, text22, text23, text24, text25, text26, text29, text30

DECLARE an instance variable JComboBox as box1, box2, box3

CREATE a method GUI()

DO

INITIALIZE the instance variable JFrame to GUIframe

SET the width of GUIframe 870px, height of 700px

INITIALIZE the instance variable JPanel to homepanel

SET the color of homepanel to LIGHT_GRAY

SET the width of homepanel 870px, height of 700px

INITIALIZE the instance variable JLabel to L1 and **SET** the title of JLabel L1 to TRANSPORT GUI

axis of L1 295px, Y-axis of 100px, width of 300px, height of 50px

INITIALIZE the font to f1 and **SET** the font of JLabel L1 as Times New Roman

SET the font of JLabel L1 as f1

INITIALIZE the instance variable JLabel to L27 and **SET** the title of JLabel L1 to Designed by :- Anju Kumari Yadav :)

SET the X-axis of L27 270px, Y-axis of 400px, width of 390px, height of 50px

INITIALIZE the font to f27 and **SET** the font of JLabel L27 as Times New

Roman

SET the font of JLabel L27 as f27

INITIALIZE the instance variable JLabel to L28 and **SET** the title of JLabel L28 to Version :- 6.6.6.6

SET the X-axis of L28 325px, Y-axis of 500px, width of 390px, height of 50px

INITIALIZE the font to f28 and **SET** the font of JLabel L28 as Times New

Roman

SET the font of JLabel L28 as f28

INITIALIZE the instance variable JButton to button1 and **SET** the title of JButton button1 to AutoRickShaw

SET the X-axis of button1 325px, Y-axis of 200px, width of 200px, height of 40px

INITIALIZE the font to ff and **SET** the font of JButton button1 as Times New Roman

SET the font of JButton button1 as ff

INITIALIZE the instance variable JButton to button2 and **SET** the title of JButton button2 to ElectricScooter

SET the X-

SET the X-axis of button2 325px, Y-axis of 300px, width of 200px, height of 40px

INITIALIZE the font to fg and **SET** the font of JButton button2 as Times New Roman

SET the font of JButton button2 as fg

INITIALIZE the instance variable JPanel to autoRickshawpanel

SET the color of autoRickshawpanel to LIGHT_GRAY

SET the width of autoRickshawpanel 870px, height of 700px

INITIALIZE the instance variable JLabel to autolabel and **SET** the title of JLabel autolabel to AutoRickShaw

SET the X-axis of autolabel 361px, Y-axis of 12px, width of 250px, height of 34px

INITIALIZE the font to auto and **SET** the font of JLabel autolabel as Times New Roman

SET the font of JLabel autolabel as auto

INITIALIZE the instance variable JLabel to L2 and **SET** the title of JLabel

L2 to Vehicle ID

SET the X-axis of L2 44px, Y-axis of 111px, width of 100px, height of 30px

INITIALIZE the font to f2 and **SET** the font of JLabel L2 as Times New Roman

SET the font of JLabel L2 as f2

INITIALIZE the instance variable JLabel to L3 and **SET** the title of JLabel

L3 to Vehicle Name

SET the X-axis of L3 478px, Y-axis of 111px, width of 125px, height of 25px

INITIALIZE the font to f3 and **SET** the font of JLabel L3 as Times New

Roman

SET the font of JLabel L3 as f3

INITIALIZE the instance variable JLabel to L4 and **SET** the title of JLabel L4 to Vehicle Weight:
axis of L4 44px, Y-axis of 162px, width of 150px, height of 25px

INITIALIZE the font to f4 and **SET** the font of JLabel L4 as Times New Roman

SET the font of JLabel L4 as f4

INITIALIZE the instance variable JLabel to L5 and **SET** the title of JLabel L5 to Vehicle Color:

SET the X-axis of L5 478px, Y-axis of 168px, width of 150px, height of 25px

INITIALIZE the font to f5 and **SET** the font of JLabel L5 as Times New Roman

SET the font of JLabel L5 as f5

INITIALIZE the instance variable JLabel to L6 and **SET** the title of JLabel L6 to Fuel Tank Capacity:

SET the X-axis of L6 44px, Y-axis of 213px, width of 150px, height of 25px

INITIALIZE the font to f6 and **SET** the font of JLabel L6 as Times New Roman

SET the font of JLabel L6 as f6

INITIALIZE the instance variable JLabel to L7 and **SET** the title of JLabel L7 to Vehicle Speed:

SET the X-axis of L7 478px, Y-axis of 213px, width of 108px, height of 25px

INITIALIZE the font to f7 and **SET** the font of JLabel L7 as Times New Roman

SET the X-
SET the font of JLabel L7 as f7

INITIALIZE the instance variable JLabel to L8 and **SET** the title of
Jlabel L8 to Vehicle Ground Clearance:

SET the X-axis of L8 44px, Y-axis of 264px, width of 146px, height of
25px

INITIALIZE the font to f8 and **SET** the font of JLabel L8 as Times New
Roman

SET the font of JLabel L8 as f8

INITIALIZE the instance variable JLabel to L9 and **SET** the title of
Jlabel L9 to Torque:

SET the X-axis of L9 478px, Y-axis of 264px, width of 56px, height of
25px

INITIALIZE the font to f9 and **SET** the font of JLabel L9 as Times New
Roman

SET the font of JLabel L9 as f9

INITIALIZE the instance variable JLabel to L10 and **SET** the title of
Jlabel L10 to Engine Displacement:

SET the X-axis of L10 44px, Y-axis of 315px, width of 160px, height of
25px

INITIALIZE the font to f10 and **SET** the font of JLabel L10 as Times
New
Roman

SET the font of JLabel L10as f10

INITIALIZE the instance variable JTextField to text2

SET the X-axis of text2 211px, Y-axis of 111px, width of 150px, height
of 25px

INITIALIZE the instance variable JTextField to text3

SET the X-axis of text3 598px, Y-axis of 111px, width of 150px, height of 25px

INITIALIZE the instance variable JTextField to text4

SET the X-axis of text4 211px, Y-axis of 162px, width of 150px, height of 25px

INITIALIZE the instance variable JTextField to text5

axis of text5 598px, Y-axis of 162px, width of 150px, height of 25px

INITIALIZE the instance variable JTextField to text6

SET the X-axis of text6 211px, Y-axis of 213px, width of 150px, height of 25px

INITIALIZE the instance variable JTextField to text7

SET the X-axis of text7 598px, Y-axis of 213px, width of 150px, height of 25px

INITIALIZE the instance variable JTextField to text8

SET the X-axis of text8 211px, Y-axis of 264px, width of 150px, height of 25px

INITIALIZE the instance variable JTextField to text9

SET the X-axis of text9 598px, Y-axis of 264px, width of 150px, height of 25px

INITIALIZE the instance variable JTextField to text10

SET the X-axis of text10 211px, Y-axis of 315px, width of 150px, height of 25px

INITIALIZE the instance variable JLabel to L11 and **SET** the title of JLabel L11 to Vehicle ID:

SET the X-

SET the X-axis of L11 44px, Y-axis of 440px, width of 83px, height of 25px

INITIALIZE the font to f11 and **SET** the font of JLabel L11 as Times New

Roman

SET the font of JLabel L11 as f11

INITIALIZE the instance variable JLabel to L12 and **SET** the title of JLabel L12 to No of Seats:

SET the X-axis of L12 44px, Y-axis of 490px, width of 87px, height of 25px

INITIALIZE the font to f12 and **SET** the font of JLabel L12 as Times New

Roman

SET the font of JLabel L12 as f12

INITIALIZE the instance variable JLabel to L13 and **SET** the title of JLabel L13 to Charge Amount:

SET the X-axis of L13 44px, Y-axis of 240px, width of 121px, height of 25px

INITIALIZE the font to f13 and **SET** the font of JLabel L13 as Times New

Roman

SET the font of JLabel L13 as f13

INITIALIZE the instance variable JLabel to L14 and **SET** the title of JLabel L14 to Booked Date:

SET the X-axis of L14 44px, Y-axis of 590px, width of 105px, height of 25px

INITIALIZE the font to f14 and **SET** the font of JLabel L14 as Times New

Roman

SET the font of JLabel L14 as f14

CREATE a main method of GUI class

DO

    new TrnasportGUI().GUI()

ENDDO

ENDDO
```

4 Method Description

4.1 Void GUI()

It is an instance method that contains all the GUI components which are used for the creation of GUI of both AutoRickShaw class and ElectricScooter class. The methods contain one JFrame, two JPanels, thirteen JButtons, thirty-two JLabels, twenty-eight JTextFields and three JComboBox. In this method, the GUI layout is designed with the help of Jcomponents. The frame and panels are set with their appropriate size and position. The labels are set with text fields, combo boxes, and also buttons are placed. All the designing and creation of the frame is done in this GUI() method. The Components are set with size and position. The panels are set with visibility and null layout managers.

4.2 actionPerformed(ActionEvent e)

It is a method that is present in the ActionListener interface. This method accepts action events as a parameter. Since the class implements the ActionListener interface, we need to provide the method body of the method in the TransportGUI. This method is all about the functionality of buttons which are added for AutoRickShaw and ElectricScooter, book electricscooter, purchase and sell electricscooter, display and clear the data from the both Autorickshaw and electricscooter. When the buttons are pressed it performs certain actions according to the scenario. The following buttons perform the following functions:

i. Add an Autorickshaw

When this button is pushed, a new object of type AutoRickshaw is created and added to an array list of Vehicle class, using the input values of the

vehicle id, vehicle name, vehicle weight, vehicle color, vehicle speed, engine displacement, torque, fuel tank capacity, and ground clearance.

ii. Book an Autorickshaw

The GUI is filled out with the Vehicle ID, booked date, charge amount, and seat count. The information dialog appears once the booked date, charge amount, and number of seats are entered into the text box along with the valid Vehicle ID. When the book button is pressed, the vehicle ID input value is checked against the already-entered vehicle ID, and if it matches, it is utilized to reserve the right autorickshaw from the list. This is how you reserve an autorickshaw from the autorickshaw class.

iii. Add an ElectricScooter

When this button is pushed, a new object of the type ElectricScooter is created and added to an array list of Vehicle class objects using the input values for the vehicle id, vehicle name, vehicle weight, vehicle color, vehicle speed, and battery capacity.

iv. Purchase an ElectricScooter

The GUI is filled out with the Vehicle ID, brand, price, charging time, mileage, and range. The information dialog for the relevant brand, price, charging time, mileage, and range appears when a valid Vehicle ID is typed into the text box. If a valid Vehicle ID has been supplied, it is used to select the right ElectricScooter from the list when the purchase button is selected and the input value of Vehicle ID is compared to the existing Vehicle ID. Here, the ElectricScooter class's method for purchasing an electric scooter is called.

v. Sell an ElectricScooter

Input of the Vehicle ID into the GUI. Display the information dialog after the valid Vehicle ID and the appropriate price have been typed in the text box. If a valid Vehicle ID has been entered, it is utilized to sell the relevant electric scooter from the array list of Vehicles when the sale button is pushed.

Otherwise, the input value of the Vehicle ID is compared to the existing Vehicle ID. This calls the ElectricScooter class's function for selling electric scooters.

vi. Display

This button performs a certain function when the display button is pressed or clicked. The input values of the text fields are added to Add for Autorickshaw or Electricscooter , and then book Autorickshaw, purchase and sell electricscooter which are stored to the array list of the Vehicle type. The display function works the same for both the AutoRickShaw and ElectricScooter Class. When the display button is pressed or clicked, all the information relating to the particular class is displayed in the terminal.

vii. Clear

When the clear button is pressed all the data from text field cleared for both Autorickshaw and Electricscooter.

viii. Back

When back button is pressed the Autorickshawpanel or electricscooterpanel go back to homepanel.

5 Testing

5.1 Testing 1

Test that the program can be compiled and run using the command prompt.

| | |
|-----------------|---|
| Test | 1 |
| Objective | Test that the program can be compiled and run using the command prompt. |
| Action | <ul style="list-style-type: none"> ✦ Locate the program in This PC and then open the command prompt. ✦ Enter the command <ul style="list-style-type: none"> - javac Vehicle.java - javac AutoRickShaw.java - javac ElectricScooter.java - javac TransprotGUI.java - java TransportGUI |
| Expected result | The program can be compiled and run while using command prompt and GUI should appear. |
| Actual result | The program can be compiled and run while using command prompt and GUI should appear. |
| Conclusion | The test was successful. |

Table 1: Test of a program compiled and run using command prompt

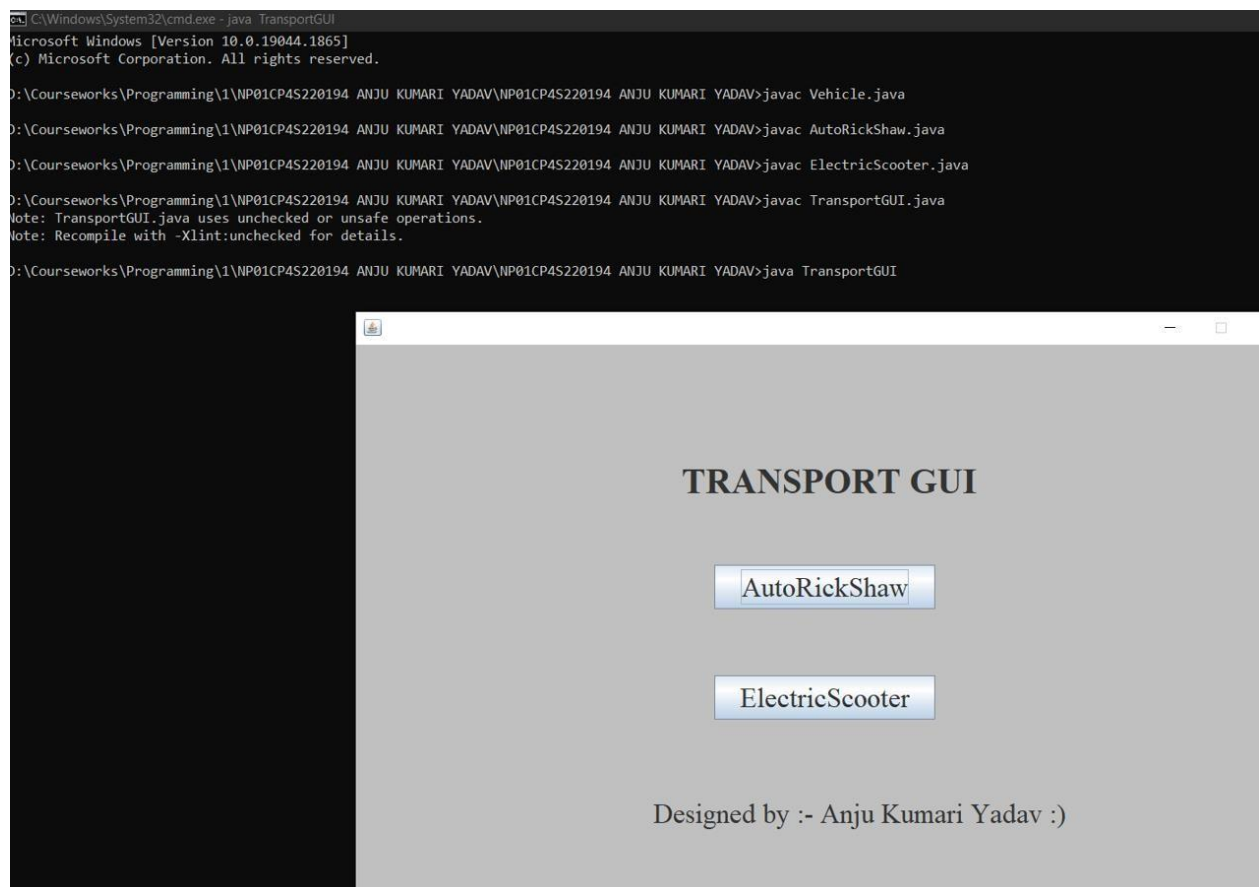

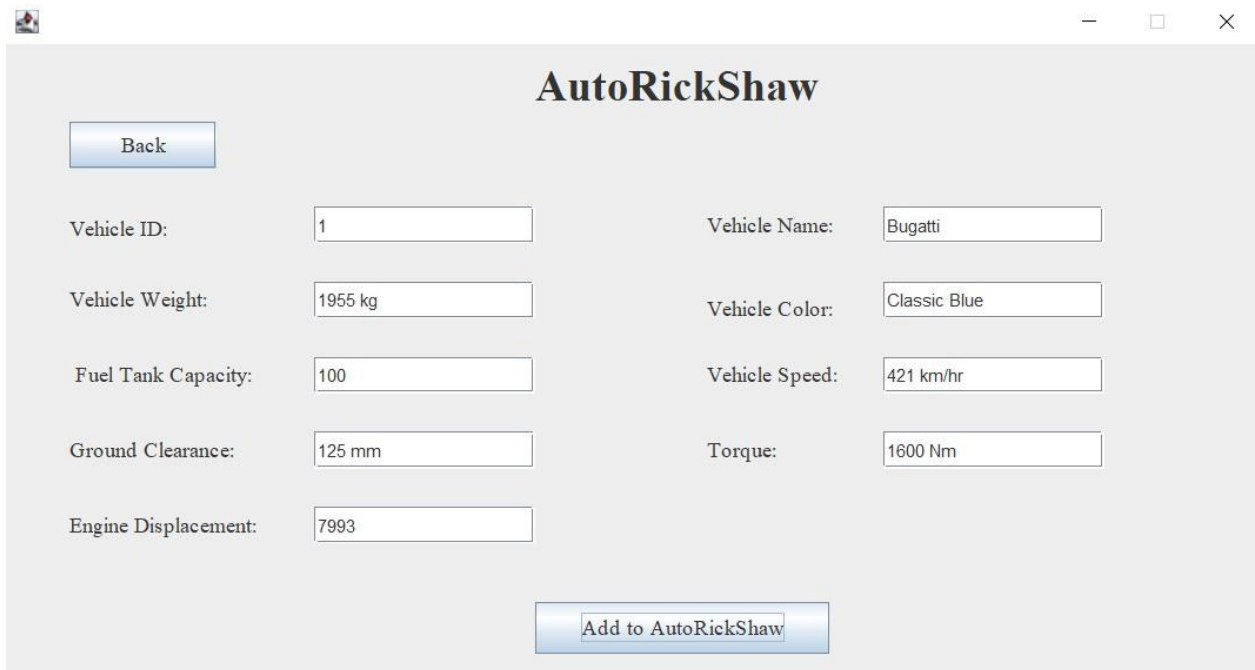

Figure 7: Screenshot of the program running in command prompt

5.2. Testing 2

i. Add the Autorickshaw

| | |
|-----------------|--|
| Test | 2(i) |
| Objective | To test add the Autorickshaw in the program. |
| Action | <p>The following values are filled in text filed for add to autorickshaw</p> <p>Int vehicleid = 1</p> <p>String vehiclename = "Bugatii"</p> <p>String vehicleweight= "1995 kg"</p> <p>Stringvehiclecolor = "Classic Blue"</p> <p>String vehiclespeed ="421 km/hr"</p> <p>Int fueltankcapacity =100</p> <p>String groundclearance = "125 mm"</p> <p>String torque = "1600 Nm"</p> <p>Int engindisplacement = 7993</p> <p>Add to Autorickshaw button is clicked.</p> |
| Expected result | When Add to Autorickshaw button will be clicked, the input values in the respective components will be added Successfully. |
| Actual result | Add to Autorickshaw was added successfully. |
| Conclusion | The test was Successful. |

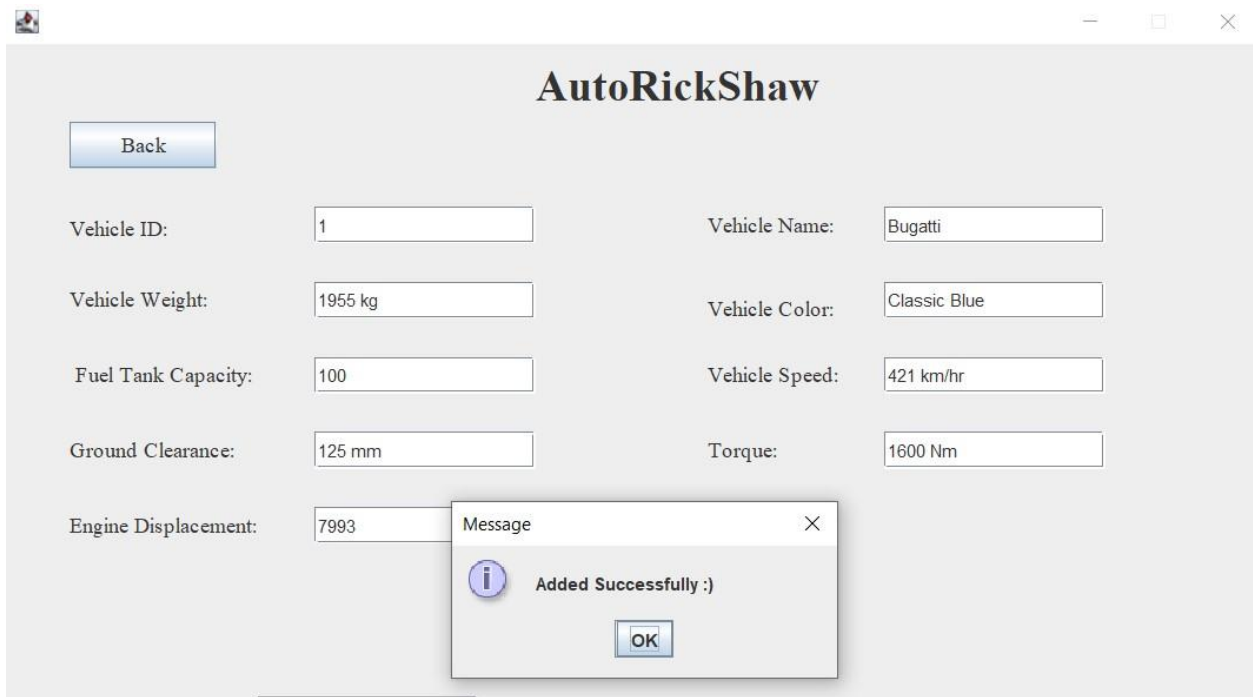

Table 2: Add button check in AutorickShaw

The screenshot shows a window titled "AutoRickShaw" with a standard Windows title bar (minimize, maximize, close buttons). Inside the window, there is a "Back" button in the top left. The main area contains a form with two columns of input fields. The left column has labels and input boxes for "Vehicle ID:", "Vehicle Weight:", "Fuel Tank Capacity:", "Ground Clearance:", and "Engine Displacement:". The right column has labels and input boxes for "Vehicle Name:", "Vehicle Color:", "Vehicle Speed:", and "Torque:". At the bottom center, there is a button labeled "Add to AutoRickShaw".

| Field | Value |
|----------------------|--------------|
| Vehicle ID: | 1 |
| Vehicle Name: | Bugatti |
| Vehicle Weight: | 1955 kg |
| Vehicle Color: | Classic Blue |
| Fuel Tank Capacity: | 100 |
| Vehicle Speed: | 421 km/hr |
| Ground Clearance: | 125 mm |
| Torque: | 1600 Nm |
| Engine Displacement: | 7993 |

Figure 8: Screenshot while entering values to Add to AutoRickShaw

The screenshot displays a web application titled "AutoRickShaw". It features a "Back" button and several input fields for vehicle details. A modal message box is currently open, indicating a successful addition.

| Field | Value |
|---------------------|--------------|
| Vehicle ID | 1 |
| Vehicle Name | Bugatti |
| Vehicle Weight | 1955 kg |
| Vehicle Color | Classic Blue |
| Fuel Tank Capacity | 100 |
| Vehicle Speed | 421 km/hr |
| Ground Clearance | 125 mm |
| Torque | 1600 Nm |
| Engine Displacement | 7993 |

ii. Book the Autorickshaw

| | |
|-----------------|--|
| Test | 2(ii) |
| Objective | To test book the Autorickshaw in the program. |
| Action | <p>The following values are filled in text filed for book to autorickshaw</p> <p style="text-align: center;"> Int vehicleid = 1 Int noofseats = 2 Int chargeamount = 1000 String bookeddate = "2020 August 10" </p> <p>Book button is clicked.</p> |
| Expected result | When book for Autorickshaw button will be clicked, the input values in the respective components will be booked Successfully. |
| Actual result | The Autorickshaw was booked successfully. |
| Conclusion | The test was Successful. |

Table 3 : Book button check in AutorickShaw

The screenshot shows a window titled "AutoRickShaw" with a standard Windows title bar (minimize, maximize, close buttons). Inside the window, there is a "Back" button in the top left. Below it, there are two columns of input fields for vehicle details:

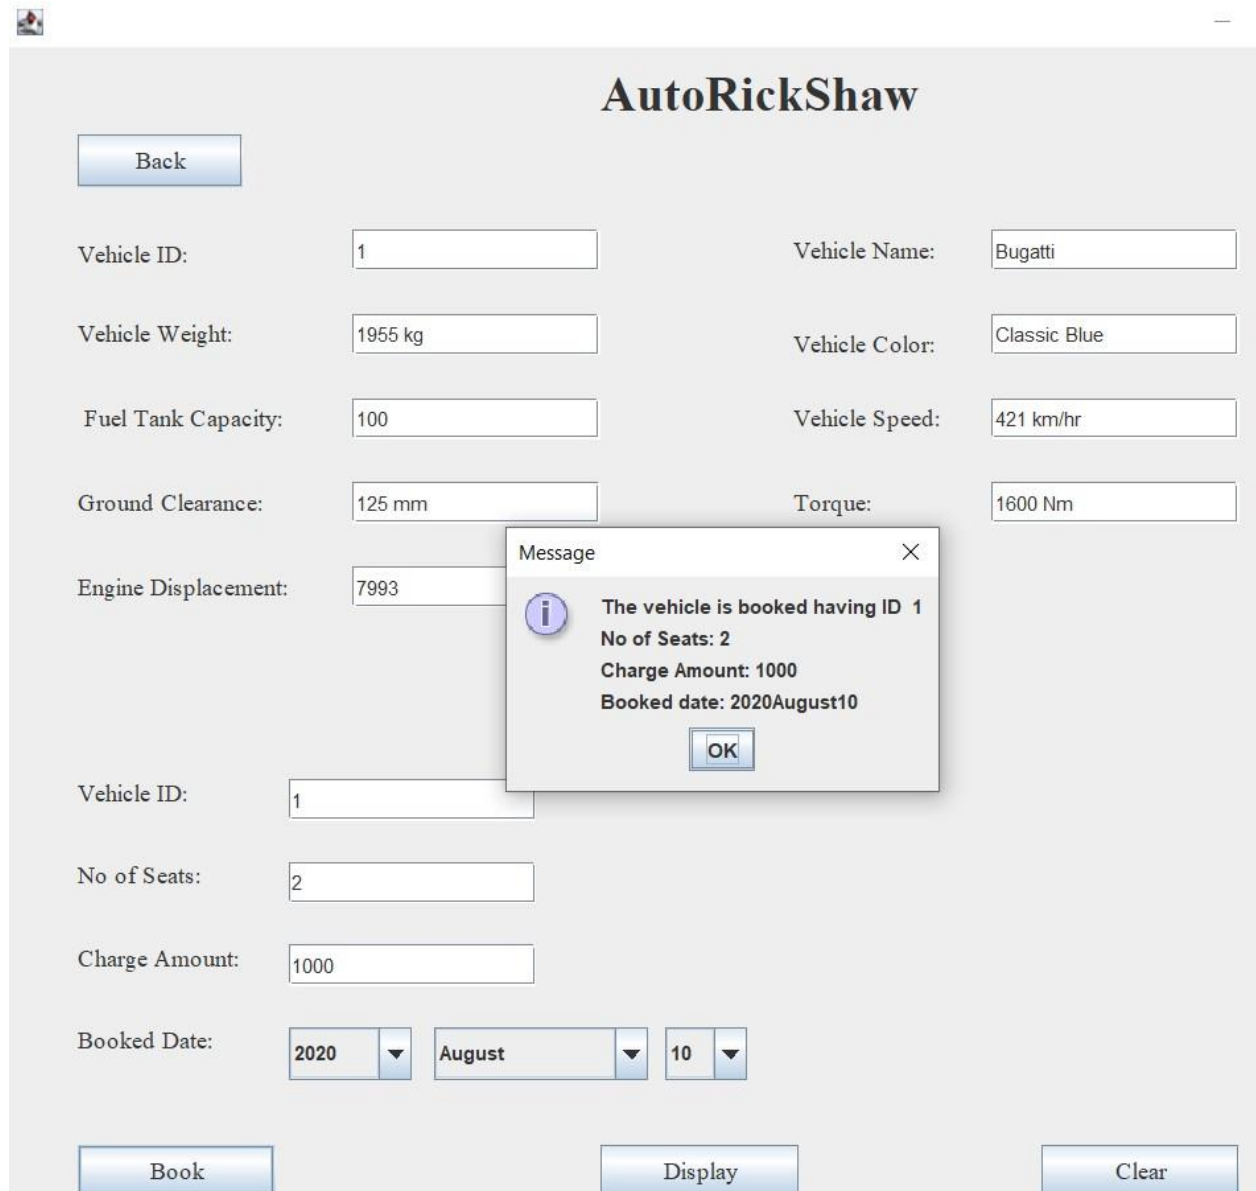

| Field | Value | Field | Value |
|----------------------|---------|----------------|--------------|
| Vehicle ID: | 1 | Vehicle Name: | Bugatti |
| Vehicle Weight: | 1955 kg | Vehicle Color: | Classic Blue |
| Fuel Tank Capacity: | 100 | Vehicle Speed: | 421 km/hr |
| Ground Clearance: | 125 mm | Torque: | 1600 Nm |
| Engine Displacement: | 7993 | | |

Below these fields is an "Add to AutoRickShaw" button. Underneath this button, there are more input fields for booking information:

| Field | Value |
|----------------|----------------|
| Vehicle ID: | 1 |
| No of Seats: | 2 |
| Charge Amount: | 1000 |
| Booked Date: | 2020 August 10 |

At the bottom of the window, there are three buttons: "Book", "Display", and "Clear".

Figure 10: Screenshot while entering values to Book AutoRickShaw

The screenshot displays the 'AutoRickShaw' application interface. At the top, there is a 'Back' button. Below it, a form contains fields for vehicle details: Vehicle ID (1), Vehicle Name (Bugatti), Vehicle Weight (1955 kg), Vehicle Color (Classic Blue), Fuel Tank Capacity (100), Vehicle Speed (421 km/hr), Ground Clearance (125 mm), and Torque (1600 Nm). A modal message box is overlaid on the form, displaying the following information: 'The vehicle is booked having ID 1', 'No of Seats: 2', 'Charge Amount: 1000', and 'Booked date: 2020August10'. Below the message box, there is an 'OK' button. At the bottom of the form, there are fields for 'No of Seats' (2), 'Charge Amount' (1000), and 'Booked Date' (2020, August, 10). At the very bottom, there are three buttons: 'Book', 'Display', and 'Clear'.

Price: Charging Time:

Rang: Mileage:

Figure 18: Screenshot of entering Invalid VehicleID to purchase ElectricScooter

The screenshot shows a web application titled "ElectricScooter". It has a "Back" button at the top left. Below it, there are two columns of input fields. The first column contains "Vehicle ID:" (value: 1), "Vehicle Weight:" (value: 1611 kg), and "Battery Capacity:" (value: 225). The second column contains "Vehicle Name:" (value: Tesla), "Vehicle Color:" (value: Black), and "Vehicle Speed:" (value: 233 km/hr). In the center, there is a blue button labeled "Add to ElectricScooter". Below this, there is another set of input fields: "Vehicle ID:" (value: 2), "Price:" (value: 500000), "Rang:" (value: 272), "Vehicle Name:" (value: Tesla), "5 hrs 45 min", and "Mileage:" (value: 576 km). A blue button labeled "Purchase to ElectricScooter" is at the bottom center. A modal message box is displayed in the center, titled "Message", with an information icon and the text "The vehicleID you entered dosen't match." and an "OK" button.

Figure 19: Screenshot of displaying an appropriate message while entering Invalid VehicleID to purchase ElectricScooter

ii. Try to sell Electricscooter with same data

| | |
|-----------|---|
| Test | 3(ii) |
| Objective | Test to sell the Electricscooter in the program by entering the same data. |
| Action | <p>The following values are filled in text filed for sell for electricScooter</p> <p style="text-align: center;">Int vehicleid =1 Int price = 600000</p> <p>Sell button is clicked.</p> |

| | |
|-----------------|---|
| Expected result | A message should that electric should already been sold. |
| Actual result | A message display that electric scooter is already sold . |
| Conclusion | The test was Successful. |

Table 8: Checking appropriate dialog box

The screenshot displays the 'ElectricScooter' application interface. At the top, there is a 'Back' button. Below it, the 'Add to ElectricScooter' section contains input fields for Vehicle ID (1), Vehicle Name (Tesla), Vehicle Weight (1611 kg), Vehicle Color (Black), Battery Capacity (225), and Vehicle Speed (233 km/hr). A button labeled 'Add to ElectricScooter' is positioned below these fields. The 'Purchase to ElectricScooter' section follows, with input fields for Vehicle ID (1), Brand (Tesla), Price (500000), Charging Time (5 hrs 45 min), Rang (272), and Mileage (576 km). A button labeled 'Purchase to ElectricScooter' is located below these fields. At the bottom of the interface, there are three buttons: 'Sell', 'Display', and 'Clear'. The 'Vehicle ID' field in the 'Sell' section is set to 1, and the 'Price' field is set to 600000.

Figure 20: Screenshot of entering the same data to sell ElectricScooter

The screenshot displays a web application titled "ElectricScooter". It features several input fields and buttons for managing electric scooters. A modal message box is currently open in the center of the screen.

Top Section:

- Back button
- Vehicle ID: 1
- Vehicle Name: Tesla
- Vehicle Weight: 1611 kg
- Vehicle Color: Black
- Battery Capacity: 225
- Vehicle Speed: 233 km/hr

Buttons:

- Add to ElectricScooter
- Purchase to ElectricScooter
- Sell
- Display
- Clear

Message Dialog Box:

The dialog box has a title bar "Message" with a close button (X). It contains an information icon (i) and the text "The Electricscooter is already Sold". There is an "OK" button at the bottom.

Bottom Section:

- Vehicle ID: 1
- Price: 500000
- Rang: 272
- Mileage: 576 km
- Price: 600000

iii. Try to book Autorickshaw with invalid vehicleid

| | |
|------|--------|
| Test | 3(iii) |
|------|--------|

| | |
|-----------------|---|
| Objective | Try to book autorickshaw with invalid vehicleid. |
| Action | <p>The following values are filled in text filed for book to autorickshaw</p> <pre> Int vehicleid = 3 Int noofseats = 3 Int chargeamount = 1000 String bookeddate = "2016 September 08" </pre> <p>Book button is clicked.</p> |
| Expected result | When book for Autorickshaw button will be clicked, the input values in the respective components won't be booked . |
| Actual result | Autorickshaw wasn't booked and message display that entered invalid id. |
| Conclusion | The test was Successful. |

Table 9: Checking appropriate dialog box

The screenshot displays the 'AutoRickShaw' web application. At the top center is the title 'AutoRickShaw'. Below it, on the left, is a 'Back' button. The main area contains two forms. The first form, at the top, has fields for 'Vehicle ID' (1), 'Vehicle Name' (Bugatti), 'Vehicle Weight' (125 kg), 'Vehicle Color' (Classic Blue), 'Fuel Tank Capacity' (100), 'Vehicle Speed' (421 km/hr), 'Ground Clearance' (125 mm), 'Torque' (1600 Nm), and 'Engine Displacement' (7993). Below this form is an 'Add to AutoRickShaw' button. The second form, below the first, has fields for 'Vehicle ID' (3), 'No of Seats' (3), 'Charge Amount' (1000), and 'Booked Date' (2016, September, 08). At the bottom of the page are three buttons: 'Book', 'Display', and 'Clear'.

AutoRickShaw

Back

Engine Displacement: 7993

Add to AutoRickShaw

Vehicle ID: 3

No of Seats: 3

Charge Amount: 1000

Booked Date: 2016 September 08

Book Display Clear

Figure 22: Screenshot of entering the same data to Book AutorickShwa

The screenshot shows the 'AutoRickShaw' application interface. At the top, there is a 'Back' button. Below it, there are two columns of input fields for vehicle details: Vehicle ID, Vehicle Name, Vehicle Weight, Vehicle Color, Fuel Tank Capacity, Vehicle Speed, Ground Clearance, Torque, and Engine Displacement. The values entered are: Vehicle ID: 1, Vehicle Name: Bugatti, Vehicle Weight: 125 kg, Vehicle Color: Classic Blue, Fuel Tank Capacity: 100, Vehicle Speed: 421 km/hr, Ground Clearance: 125 mm, Torque: 1600 Nm, and Engine Displacement: 7993. A message dialog box is displayed in the center, with the title 'Message' and a close button (X). The message text is 'The vehicleID you entered dosen't match.' (Note: 'dosen't' is a typo for 'doesn't'). There is an 'OK' button at the bottom of the dialog box. Below the dialog box, there are more input fields: Vehicle ID: 3, No of Seats: 3, Charge Amount: 1000, and Booked Date: 2016, September, 08. At the bottom of the form, there are three buttons: 'Book', 'Display', and 'Clear'.

Figure 23: Screenshot of displaying an appropriate message while entering the same data to Book AutorickShaw

6 Error Detection and Correction

a. Syntax Error

A syntax error occurs when a programmer makes a mistake in the syntax of the code while developing it. This problem affects applications while they are running. The compiler quickly detects these problems, and the programmer must correct that to run the program.

i. Syntax Error Detection

The return type of the method was not indicated, which was a syntax error.

```
ArrayList <Vehicle> vehiclelist = new ArrayList <Vehicle>();

private JFrame GUIframe;
private JPanel homepage, autoRickshawpanel, electric scooterpanel;
private JButton button1, button2, backbtn, addbtn, bookbtn, disbtn, clearbtn, backbtn1, addbtn1, purbtn1, s
private JLabel L1, L27, L28, autolabel1, L2, L3, L4, L5, L6, L7, L8, L9, L10, L11, L12, L13, L14, L15, electriclabel
private JTextField text1, text2, text3, text4, text5, text6, text7, text8, text9, text10, text11, text12, tex
private JComboBox box1, box2, box3;
public GUI()
{
    //Creating frame for homepage
    GUIframe = new JFrame();
    GUIframe.setSize(870, 750);
}
```

invalid method declaration; return type required

Figure 24: Screenshot when Syntax Error Detected

ii. Syntax Error Correction

The compiler caught the error, which was fixed by mentioning method's appropriate return type

```
private JButton button1, button2, backbtn, addbtn, bookbtn, disbtn, clearbtn, backbtn1, addbtn1, purbtn1, selidbtn1, disbtn1, cl
private JLabel L1, L27, L28, autolabel1, L2, L3, L4, L5, L6, L7, L8, L9, L10, L11, L12, L13, L14, L15, electriclabel, L16, L17, L18, L19, L
private JTextField text1, text2, text3, text4, text5, text6, text7, text8, text9, text10, text11, text12, text13, text14, text15,
private JComboBox box1, box2, box3;
public void GUI()
{
    //Creating frame for homepage
    GUIframe = new JFrame();
    GUIframe.setSize(870, 750);

    //jpanel for homepage
    homepage = new JPanel();
}
```

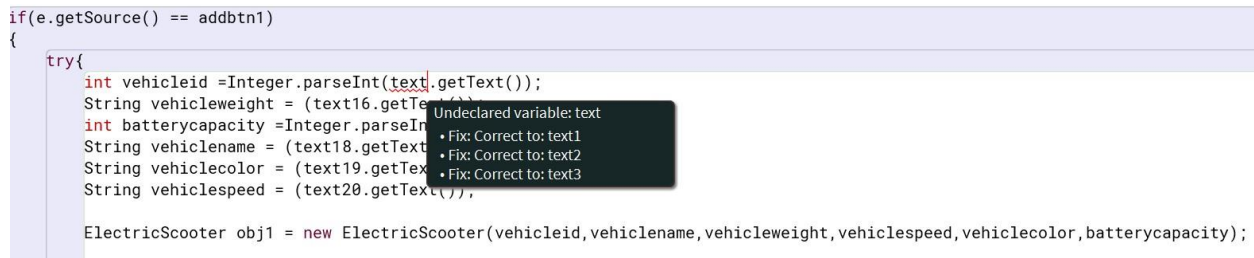

Figure 25: Screenshot when Syntax Error Corrected

b. Semantic Error

When a statement is syntactically correct but does not fulfill the function expected by the compiler as per the user requirement, it is called a semantic mistake. Compilers have improved their ability to detect several types of basic semantic errors in programming.

i. Semantic Error Detection

One variable was not declared but was used, which was a semantic error. This problem was discovered during the compilation of the application.

```

if(e.getSource() == addbtn1)
{
    try{
        int vehicleid =Integer.parseInt(text1.getText());
        String vehicleweight = (text16.getText());
        int batterycapacity =Integer.parseInt(text17.getText());
        String vehiclename = (text18.getText());
        String vehiclecolor = (text19.getText());
        String vehiclespeed = (text20.getText());

        ElectricScooter obj1 = new ElectricScooter(vehicleid,vehiclename,vehicleweight,vehiclespeed,vehiclecolor,batterycapacity);
    }
}

```

Figure 26: Screenshot when Semantic Error Detected

ii. Semantic Error Correction

This was fixed by declaring the variable with the appropriate data type.

```

if(e.getSource() == addbtn1)
{
    try{
        int vehicleid =Integer.parseInt(text15.getText());
        String vehicleweight = (text16.getText());
        int batterycapacity =Integer.parseInt(text17.getText());
        String vehiclename = (text18.getText());
        String vehiclecolor = (text19.getText());
        String vehiclespeed = (text20.getText());

        ElectricScooter obj1 = new ElectricScooter(vehicleid,vehiclename,vehicleweight,vehiclespeed,vehiclecolor,batterycapacity);
    }
}

```

Figure 27: Screenshot when Semantic Error Corrected

c. Logical Error

A logic error occurs when our program compiles and runs but does not produce the desired result. These flaws are undetectable by neither the compiler nor the JVM.

i. Logical Error Detection

The error was found in the printing statement. The variables mileage and range were interchanged. Instead, range and mileage were printed and vice versa.

```
if(e.getSource() == button2)
{
    electricscooterpanel.setVisible(false);
    autoRickshawpanel.setVisible(true);
    homepanel.setVisible(false);
}

else if(e.getSource() == button2)
{
    electricscooterpanel.setVisible(true);
    autoRickshawpanel.setVisible(false);
    homepanel.setVisible(false);
}
```

Figure 28: Screenshot when Logical Error Detected

ii. Logical Error Correction

This error was corrected by interchanging the variables as shown in the figure below.

```
f(e.getSource() == button1)
{
    electricscooterpanel.setVisible(false);
    autoRickshawpanel.setVisible(true);
    homepanel.setVisible(false);
}

lse if(e.getSource() == button2)
{
    electricscooterpanel.setVisible(true);
    autoRickshawpanel.setVisible(false);
    homepanel.setVisible(false);
}
```

Figure 29: Screenshot when Logical Error Corrected

7 Conclusion

As a result, Java is an advanced object-oriented programming language. The idea was the creation of James Gosling. Programming was the subject that was most important for us to learn. Java is case-sensitive, thus we encountered a ton of issues everywhere. But gradually, we were able to overcome that obstacle with the help of our lecturers and friends.

The primary goal of the coursework is to add a class to the project that we created for the first portion of the coursework in order to create a graphical user interface for a system that stores information on vehicles, including both autorickshaw and electric scooter classes. This coursework consists of four classes: vehicles, autorickshaws, electric scooters, and transport GUI. The primary class is vehicle, and there are two subclasses under it: autorickshaw and electric scooter. The Vehicle class inherits both subclasses. The following actions were taken: add for autorickshaw and electric scooter, book to autorickshaw, buy and sell to electric scooter, display and clear procedures. The curriculum is formed into a Simple GUI.

We have gained a lot of knowledge from this course work. For the first time, we had to create this kind of coursework, where we had to create a GUI for a vehicle that holds all information, including an autorickshaw, an electric scooter, and a class on transport GUI. Making the GUI required a lengthy and complex procedure. A separate TransportGUI class needed to be created, in which all methods and tasks were to be completed, run, and complied. Event handling, Exception handling, Java GUI mechanism, and ActionListener implementation are the things we learned. Even we experienced a lot of misunderstanding and difficulties when doing our coursework. Even we are unsure about how to begin a course. But we were able to finish the coursework with the aid of the teacher, the lecture and tutorial slides, and friends.

We were able to complete the assignment and turn it in on time after dealing with all the issues that came up while conducting the coursework. Re-watching and going through the slides helped to clarify the even handling and exception handling ideas. We completed the coursework in this manner, submitting it on time.

8 Appendix

```
import javax.swing.*;
import java.awt.*; import
java.awt.event.*;
import java.util.ArrayList;

public class TransportGUI implements ActionListener
{
    ArrayList <Vehicle> vehiclelist = new ArrayList <Vehicle>();
